*Figure 11a*

#	Message Name	Description of Message Function	Fault Tolerance and Recovery if Message is Lost
1.	New Job	The initial message used by a user to submit a new job for processing.	Because New Job is normally initiated by the user, it is up to the user to retry in the event a Result Job (Message #2) is not received by the user.
2.	Result Job	Result Job is sent by a supervisor to a user interface to confirm that a job was submitted.	It is up to the user to retry in the event a Result Job (Message #2) is not received by the user. However, because of the nature of TCP/IP, it is unlikely this message would be lost if the New Job message was received by the supervisory daemon.
3.	Start Job	Start Job sent by supervisor to a worker to order the worker to start a processing job.	Loss of Start Job is typically resolved when the supervisor resends Start Job to the same node and obtains an Accept reply. If an Accept reply is not received, or is a Reject reply is received, the supervisor sends a Start Job message to a different suitable node.
4.	Accept/Reject	Accept/Reject is used to convey the acceptance or rejection of a job by a worker. If the worker sends an acceptance as the contents of the message, the work undertakes processing and tracking the job. If the worker sends a rejection as the contents of the message, then the job is remains in one or more job queues.	Failure to receive Accept/Reject is not tolerated; the supervisor periodically resends a Start until an Accept/Reject is received or a time out or other decision point is reached. After a time-out, the supervisor normally sends a Remove Job to the worker that failed to respond, deletes that worker from the list of available workers, and sends Start Job to another suitable node.

**Figure 11B**

5.	Query Job	Query Job requests the status of a job being processed on a worker. The query occurs in order to transfer data from the worker to the querying process without using files.	Failure to receive a Job Detail in reply is handled by resending Query Job.
6.	Job Detail	Job Details responds to a Query Job, and provide information about the job and worker.	Loss of this message is handled by the querying process by resending Query Job.
7.	Job Status Query	Job Status Query queries the processing status of the job. It asks whether processing is continuing on the worker.	Failure to receive a Job Status Reply in reply is handled by resending Job Status Query until a Job Status Reply is received or a time out or other decision point is reached.
8.	Job Status Reply	Job Status Reply is sent by a worker to the querying process, usually on the supervisor. It is sent after the worker has recorded any new information contained in a Job Status Query in its internal cache.	Loss of Job Status Reply is tolerated and no resolution is required; the querying process periodically resends a Job Status Query, which should generate a subsequent Job Status Reply.
9.	Confirm	Confirm is sent to a worker by a supervisor in response to a Job Status Reply. It helps to ensure that the supervisor has correctly recorded the data.	Failure to receive a Reconfirm in reply is handled by resending Confirm until a Reconfirm is received or a time out or other decision point is reached.
10.	Reconfirm	Reconfirm is sent in response to Confirm.	Loss of Reconfirm is tolerated and no resolution is required; the sending process periodically resends a Confirm, which should generate a subsequent Reconfirm.

*Figure 11C*

11.	Worker Update	Immediately after a worker's capabilities have changed, the worker sends Worker Update to the supervisor.	Failure to receive an Update Confirm in reply is handled by resending Worker Update until an Update Confirm is received or a time out or other decision point is reached.
12.	Update Confirm	The supervisor responds to a Worker Update by sending the worker an Update Confirm.	Loss of Update Confirm is tolerated and no resolution is required; the sending process periodically resends a Worker Update, which should generate a subsequent Update Confirm.
13	Job Complete	Job Complete is sent by a worker to a supervisor upon completion of a processing job.	Failure to receive a Confirm Complete in reply is handled by resending Job Complete until a Confirm Complete is received or a time out or other decision point is reached.
14.	Confirm Complete	Confirm Complete is sent by a supervisor to a worker to confirm that the worker has completed a job.	Loss of Confirm Complete is tolerated and no resolution is required; the sending process periodically resends a Job Complete, which should generate a subsequent Confirm Complete.
15.	Remove Job	Remove Job is sent by a supervisor to a worker to terminate a job. It is used to interrupt job processing for a higher priority job, or because a related job requires that all jobs in a job group cease processing, or for other reasons.	Failure to receive a Confirm Remove in reply is handled by resending Remove Job until a Confirm Remove is received or a time out or other decision point is reached.

**Figure 11D**

16	Confirm Remove	Confirm Remove is sent by a worker to a supervisor to confirm that the relevant job has been removed.	Loss Confirm Remove is tolerated and no resolution is required; the sending process periodically resends a Remove Job, which should generate a subsequent Confirm Remove.
17	Worker Unavailable	Worker Unavailable is sent by a worker to a supervisor when before the worker goes off-line (becomes unavailable).	Failure to receive a Confirm Unavailable in reply is handled by resending Worker Unavailable until a Confirm Unavailable is received or the worker is forced off-line or fails.
18	Confirm Unavailable	Confirm Unavailable is sent by a supervisor to a worker to confirm that the worker is going off-line. The supervisor deletes the worker from the list of available workers.	Loss of the message is tolerated and no resolution is required; the worker goes off-line or fails.

Agenda Table

Field	Type	Description
name	TEXT	Name of agenda item
INDEX	(name(16))	Index field based on the name
status	INTEGER	Status of agenda item
host	CHAR(255)	Work item execution host
data	TEXT	Pointer to agenda item data structure
subid	INTEGER	Agenda item subjob ID
address	INTEGER	Worker Host IP Address
lastupdate	INTEGER	Time of last update

**Figure 17**

Callback Helper Table

Field	Type	Description
uq	INTEGER PRIMARY KEY AUTO INCREMENT	Unique ID of event
pid	INTEGER	Parent ID associated with event
pgrp	INTEGER	Process group ID associated with event
category	INTEGER	Event category
jobid	INTEGER	Job ID associated with event
subid	INTEGER	Subjob ID associated with event
workid	TEXT	Worker ID associated with event
start	INTEGER	Start Time to Execute
inter	INTEGER	Interval Time to Execute
extra	TEXT	Extra data to describe event
name	TEXT	Event's name
flag	INTEGER	
callback	INTEGER	ID of associated callback
label	TEXT	Event label
lastupdate	INTEGER	Time of last update

**Figure 18**

Callback Table

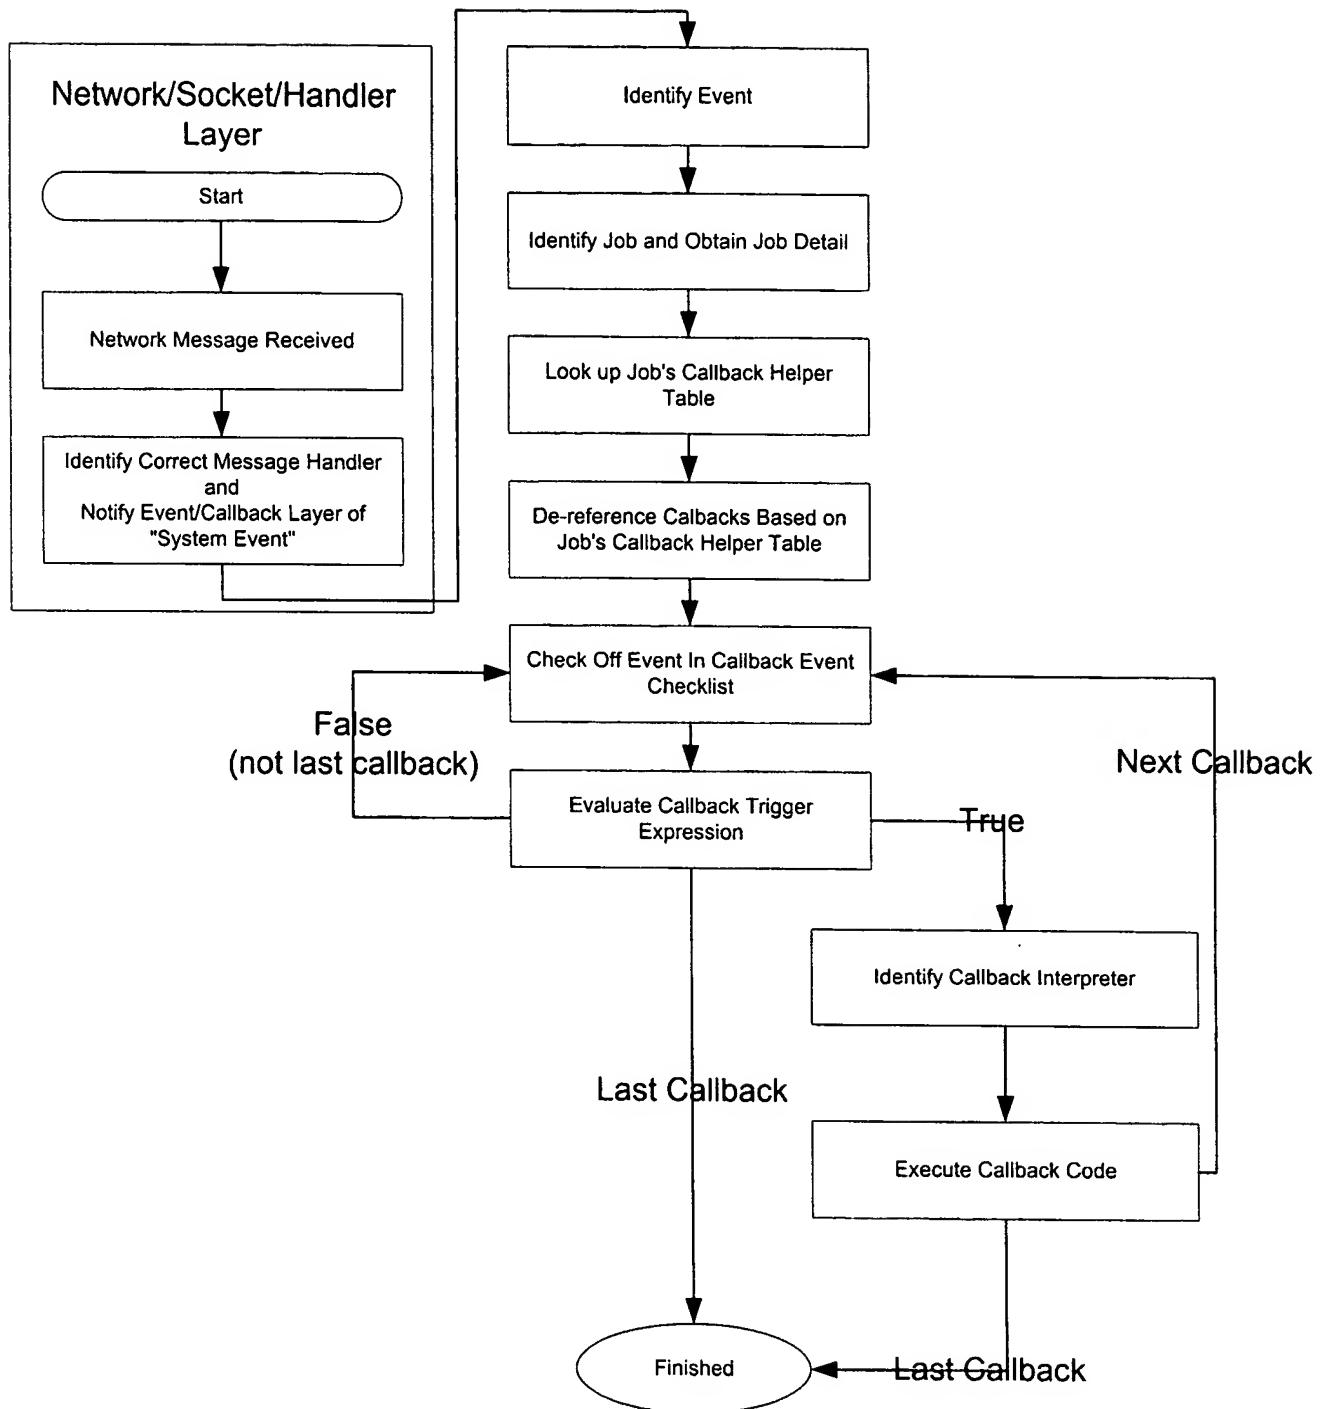

Field	Type	Description
id	INTEGER PRIMARY KEY AUTO INCREMENT	Callback ID Number
language	INTEGER	Language binding for callback code execution
code	TEXT	Callback code to be executed if triggers evaluate to TRUE
count	INTEGER	Total times callback was executed
max	INTEGER	Maximum times callback will execute
triggers	TEXT	Expression combining list of events needed to activate callback code. Expression must evaluate to TRUE before callback code can be executed.
ready	TEXT	Event check list encoded as text
user	TEXT	User name callback registered to
lastupdate	INTEGER	Time of last update

**Figure 19**

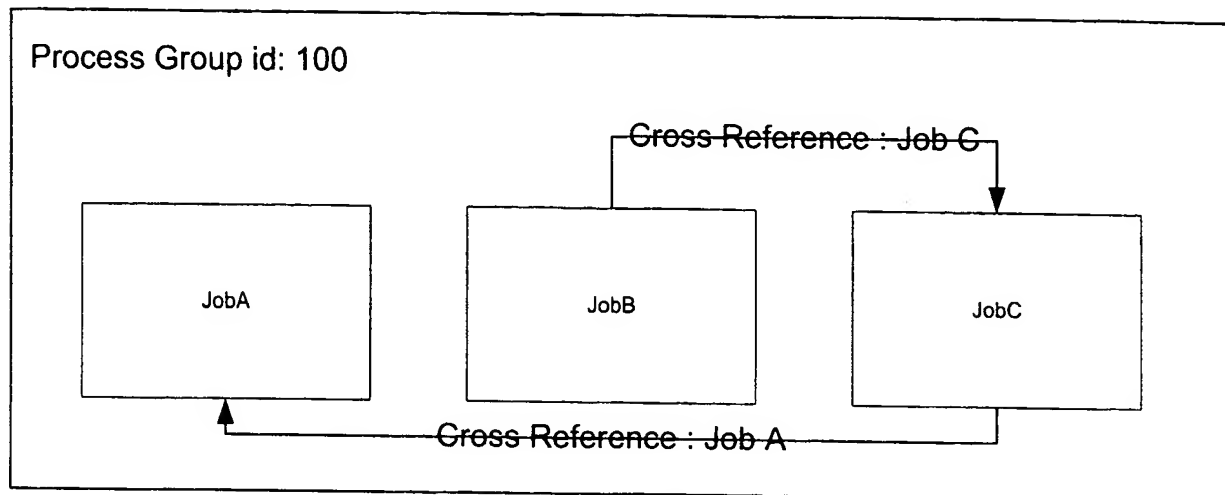

Subjob Table

Field	Type	Description
id	INTEGER	ID number of subjob
status	INTEGER	Current status of subjob
host	TEXT	Name of host executing subjob
address	INTEGER	IP address of host executing subjob
reserve	INTEGER	(0 by default) Reservation Lock
lastupdate	INTEGER	Time of last update
data	TEXT	Subjob Package data
